Theorem 1

Let A be a unital uniform algebra, T_{φ} is an isometric endomorphism of A and $w \in A$. Let $T = wT_{\varphi}$. Assume that φ is an open map of ∂A onto itself. Then,

$$\sigma_{usf}(T,A) = \sigma_{a.p.}(T,A) = \sigma_{a.p.}(T,C(\partial A)).$$

Corollary 4

Assume the conditions of Theorem 1. Assume additionally that the uniform algebra A is analytic and that $T_{\varphi}^{n} \neq I, n \in \mathbb{N}$. Then the set $\sigma_{usf}(T)$ is rotation invariant.

۲

 In the next theorem we will investigate the conditions that guarantee that the set {|λ| : λ ∈ σ(T)} is connected. In other words, we are interested in the presence (or the absence) of circular holes in the spectrum σ(T, A).

Theorem 5

٥

Let A be a unital uniform algebra, T_{φ} is an isometric endomorphism of A and $w \in A$. Let $T = wT_{\varphi}$. Assume that φ is an open map of ∂A onto itself. The following conditions are equivalent.

(1). There is a positive real number r such that $\sigma(T) = \sigma_1 \cup \sigma_2$ where $\sigma_i \neq \emptyset, i = 1, 2, \sigma_1 \subset \{\lambda \in \mathbb{C} : |\lambda| < r\}$, and $\sigma_2 \subset \{\lambda \in \mathbb{C} : |\lambda| > r\}$. (2). There is a closed ideal J of A such that

$$\quad \textbf{O} \quad TJ \subset J \text{ and } \sigma(T,J) \subset \{\lambda \in \mathbb{C} : |\lambda| < r\}.$$

- **()** The algebra A|h(J), where $h(J) \subset \mathfrak{M}_A$, is the hull of the ideal J, is closed in C(h(J)).
- The algebras A|h(J) and A|E, where E = h(J) ∩ ∂A, are isometric and A|E is closed in C(E).
- (d) Moreover, $Int_{\partial A}E \neq \emptyset$.

) The operator $T = wT_{\varphi}$ acts on A|E and $\sigma(T, A|E) \subset \{\lambda \in \mathbb{C} : |\lambda| > r\}.$

In the case when T_φ is an automorphism the statement in the previous theorem become much simpler: M_A = M₁ ∪ M₂, where M₁ and M₁ are disjoint φ-invariant closed subsets of M_A.

 $\sigma(T, C(\mathfrak{M}_1) \subset r\mathbb{D}, \sigma(T, C(\mathfrak{M}_2)) \subset \mathbb{C} \setminus r\mathbb{D}.$

くぼう くほう くほう しほ

In the case when T_φ is an automorphism the statement in the previous theorem become much simpler: M_A = M₁ ∪ M₂, where M₁ and M₁ are disjoint φ-invariant closed subsets of M_A.

$$\sigma(T, C(\mathfrak{M}_1) \subset r\mathbb{D}, \sigma(T, C(\mathfrak{M}_2)) \subset \mathbb{C} \setminus r\mathbb{D}.$$

 In the case of non-invertible isometric endomorphisms we have currently to put up with the rather ugly conditions in Theorem 5. Nevertheless, we see that in the conditions of this theorem the hull of the ideal *J* contains an open subset of *∂A*, which immediately provides the next corollary.

通 ト イ ヨ ト イ ヨ ト

Corollary 6

Assume conditions of Theorem 5. Assume additionally that the algebra A is analytic. Then the set $\{|\lambda| : \lambda \in \sigma(T, A)\}$ is connected. If we also assume that $T_{\varphi}^{n} \neq I$, $n \in \mathbb{N}$, then $\sigma(T, A)$ is a connected rotation invariant subset of \mathbb{C} .

Corollary 6

Assume conditions of Theorem 5. Assume additionally that the algebra A is analytic. Then the set $\{|\lambda| : \lambda \in \sigma(T, A)\}$ is connected. If we also assume that $T_{\varphi}^{n} \neq I$, $n \in \mathbb{N}$, then $\sigma(T, A)$ is a connected rotation invariant subset of \mathbb{C} .

۲

• We complement Theorems 1 and 5 by the following simple corollary.

Corollary 7

Let A be a unital uniform algebra, T_{φ} be an isometric non-invertible endomorphism of A and $w \in A$. Assume that |w| > 0 on ∂A . Then $\rho_{min}(T)\mathbb{U} \subset \sigma_r(T, A)$, where

$$\rho_{\min}(T) = \min_{\mu \in M_{\varphi}} \exp \int \ln |w| d\mu,$$

 M_{φ} is the set of all φ -invariant probability measures in $C(\partial A)'$, and $\sigma_r(T, A) = \sigma(T, A) \setminus \sigma_{a.p.}(T, A)$.

۲

周 ト イヨ ト イヨ ト ニヨ

Corollary 7

Let A be a unital uniform algebra, T_{φ} be an isometric non-invertible endomorphism of A and $w \in A$. Assume that |w| > 0 on ∂A . Then $\rho_{min}(T)\mathbb{U} \subset \sigma_r(T, A)$, where

$$\rho_{\min}(T) = \min_{\mu \in M_{\varphi}} \exp \int \ln |w| d\mu,$$

 M_{φ} is the set of all φ -invariant probability measures in $C(\partial A)'$, and $\sigma_r(T, A) = \sigma(T, A) \setminus \sigma_{a.p.}(T, A)$.

۲

Thus, σ_r(T, A) consists of all the points in σ(T, A) such that the operator λI – T has the left inverse.

• Weighted automorphisms of the disk-algebra.

- In this example A is the disk-algebra: the algebra of all functions analytic in the open unit disk U and continuous in the D = c/U. We consider A as a closed subalgebra of C(T), where T is the unit circle. Any weighted automorphism of A is of the form T = wT_φ, where w ∈ A and φ : D → D is a Möbius transformation.
- The spectrum of weighted automorphisms of the disk-algebra was first described by the late Herbert Kamowitz in 1978. Here we will provide some additional details.

くほう イヨン イヨン 二日

Case 1. φ is an elliptic Möbius transformation and there is an n∈ N such that φⁿ(z) ≡ z, z ∈ D (i.e. φ is conformally equivalent to a periodic rotation). We assume that n is the smallest positive integer such that Tⁿ_φ = I. Then,

$$\sigma(wT_{\varphi}) = \{\lambda \in \mathbb{C} : \exists z \in \mathbb{D} \text{ such that } \lambda^n = w_n(z)\},\$$

$$\sigma_{a.p.}(wT_{\varphi}) = \sigma_{usf}(wT_{\varphi}) = \{\lambda \in \mathbb{C} : \exists z \in \mathbb{T} \text{ such that } \lambda^n = w_n(z)\}.$$

く 同 ト く ヨ ト く ヨ ト

Case 2. φ is either an elliptic Möbius transformation such that *T*ⁿ_φ ≠ *I*, *n* ∈ ℕ or a parabolic Möbius transformation. Let ζ be the unique fixed point of φ in D.
(a) If w is invertible in A then

$$\sigma_{usf}(wT_{\varphi}) = \sigma(wT_{\varphi}) = w(\zeta)\mathbb{T}.$$

(b) If w is not invertible in A but |w| > 0 on \mathbb{T} then

$$\sigma(wT_{\varphi}) = w(\zeta)\mathbb{D} \text{ and } \sigma_{usf}(wT_{\varphi}) = w(\zeta)\mathbb{T}.$$

(c) If $w(\xi) = 0$ for some $\xi \in \mathbb{T}$ then

$$\sigma(wT_{\varphi}) = \sigma_{usf}(wT_{\varphi}) = w(\zeta)\mathbb{D}.$$

伺下 イヨト イヨト

Case 3. φ is a hyperbolic Möbius transformation. Let ζ₁, ζ₂ ∈ T be the fixed points of φ. Assume that |φ'(ζ₁)| < 1 and |φ'(ζ₂)| > 1. To avoid minor details we will assume that w is an invertible element of A.

(a) If $|w(\zeta_1)| > |w(\zeta_2)|$ then

$$\sigma_{\textit{usf}}(wT_{\varphi}) = \sigma(wT_{\varphi}) = \{\lambda \in \mathbb{C} : |w(\zeta_2| \le |\lambda| \le |w(\zeta_1)|\}$$

(b) If $|w(\zeta_2)| > |w(\zeta_1)|$ then

$$\sigma(wT_{\varphi}) = \{\lambda \in \mathbb{C} : |w(\zeta_2| \le |\lambda| \le |w(\zeta_1)|\},\\ \sigma_{usf}(wT_{\varphi}) = w(\zeta_1)\mathbb{T} \cup w(\zeta_2)\mathbb{T}.$$

(c) If $|w(\zeta_2)| = |w(\zeta_1)|$ then

$$\sigma_{usf}(wT_{\varphi}) = \sigma(wT_{\varphi}) = w(\zeta_1)\mathbb{T}.$$

• Weighted endomorphisms of the disk-algebra.

Any isometric endomorphism of the disk-algebra A is of the form

$$(T_{\varphi}f)(z) = f(B(z)), f \in A, z \in \mathbb{D},$$

where B is a finite Blaschke product. We assume that B has at least two factors, i.e., it is not a Möbius transformation.

く 同 ト く ヨ ト く ヨ ト

 Let w ∈ A and T = wT_φ. Theorems 1 and 5 guarantee that σ(T) is a disk (or the singleton {0}) and that the sets σ_{a.p.}(T) = σ_{usf}(T) are rotation invariant. The complicated dynamics of finite Blaschke products on the unit circle currently prevents us from obtaining more information about the spectrum and the essential spectra of T.

- Let w ∈ A and T = wT_φ. Theorems 1 and 5 guarantee that σ(T) is a disk (or the singleton {0}) and that the sets σ_{a.p.}(T) = σ_{usf}(T) are rotation invariant. The complicated dynamics of finite Blaschke products on the unit circle currently prevents us from obtaining more information about the spectrum and the essential spectra of T.
- Even the computation of the spectral radius $\rho(T)$ becomes nontrivial (unless *B* is a Möbius transformation). The well-known formula

$$\rho(T) = \max_{\mu \in M_{\varphi}} \exp \int \ln |w| d\mu,$$

where M_B is the set of all *B*-invariant probability measures in $C(\mathbb{T})'$, becomes practically useless, because the set M_B is very large and does not allow a simple description.

• Let us consider for example the following two seemingly simple operators.

$$(T_1f)(z) = \left(\frac{1+z}{2}\right)f(z^2),$$

$$(T_2f)(z) = \left(\frac{1-z}{2}\right)f(z^2),$$

$$f \in A, z \in \mathbb{D}.$$

イロト 不得 トイヨト イヨト

• Let us consider for example the following two seemingly simple operators.

$$(T_1f)(z) = \left(rac{1+z}{2}
ight)f(z^2),$$

 $(T_2f)(z) = \left(rac{1-z}{2}
ight)f(z^2),$
 $f \in A, z \in \mathbb{D}.$

It is trivial that ρ(T₁) = 1, and some elementary calculations show that ρ(T₂) = 1/2. Thus, σ(T₁) = D and σ(T₂) = 1/2D. But, beyond the fact that the sets σ_{a.p.}(T_i), i = 1, 2, are rotation invariant and the trivial inclusions {0} ∪ T ⊂ σ_{a.p.}(T₁) and {0} ∪ 1/2T ⊂ σ_{a.p.}(T₂) hold, we cannot say anything else about the sets σ_{a.p.}(T_i), i = 1, 2.
